(54) Tide: CHEWING GUM COMPOSITION WITH ACCELERATED, CONTROLLED RELEASE OF ACTIVE AGENTS

(57) Abstract

A chewing gum composition with accelerated, controlled release of active agents comprising one or more active agents, a chewing gum base and optionally conventional auxiliary agents and additives. The chewing gum is prepared on the basis of a chewing gum base having a resin component containing at least 25 weight % of a particular resin. The accelerated, controlled release of the active agents is obtained by adding at least one solubilizer in a quantity of 0.1-30 weight % to the chewing gum composition.

DESIGNATIONS OF "DE"

Until further notice, any designation of "DE" in any international application whose international filing date is prior to October 3, 1990, shall have effect in the territory of the Federal Republic of Germany with the exception of the territory of the former German Democratic Republic.

Title: Chewing gum composition with accelerated controlled release of active agents

5 Technical Field

The present invention relates to a chewing gum composition with accelerated controlled release of active agents comprising one or more active agents, a chewing gum base 10 and optionally usual auxiliary agents and additives. The invention furthermore relates to a process for the preparation of a chewing gum composition and the use of a solubilizer for accelerated controlled release of active agents in a chewing gum composition.

15

Background Art

In recent years there has been great interest in finding methods of releasing active agents from chewing gum in a 20 controlled manner. The extensive interest is both due to the wish to use chewing gum as a delivery system, for instance for drugs, and the wish to be able to release costly ingredients, such as flavours (aromas) and highly potent (or intensive) sweeteners, in moderate quantities 25 during the relatively short chewing period.

Many factors determine the extent and speed of the release of a substance from a chewing gum. A decisive feature is the solubility of the substance. A substantially water-30 soluble substance is thus usually released quickly, whereas a substantially fat-soluble substance is bound more or less firmly to the water-insoluble ingredients of the chewing gum, the latter causing a slower and sometimes insufficient release during the usual chewing period.

35

The ratio of soluble to insoluble ingredients in the chewing gum composition, the size of the chewing gum piece,

as well as the chewing intensity and the secretion of saliva of the chewer are also of importance to the release. Usually it is neither possible nor desirable to alter the latter factors.

5

Therefore it is necessary to involve other methods when it is desired to influence the release. In general, such methods aim at influencing the dissolution rate of the substance by coating, absorption or adsorption or by 10 encapsulation in other materials. Hydrophilic compounds can be used for substances of a poor water-solubility as a means for achieving an improved and faster release. Examples of such substances with relatively limited solubility are for instance flavourings and relatively 15 sparingly soluble sweeteners having a strong sweetening effect such as saccharine and aspartame, as well as many drugs.

It is a well-known problem in chewing gum preparation 20 that only a small share of the aroma agents added are released from the chewing gum within the usual chewing period of 2 to 10 minutes. It is not unusual that the amount of aroma agent released stated as a percentage of the total quantity of aroma agent added, is of the follow- 25 ing order:

After chewing for 2 minutes: 5 to 15%
After chewing for 5 minutes: 7 to 20%
After chewing for 10 minutes: 10 to 25%

30

Which means that a very large share, 75 to 90% of the aroma agents added is wasted when the chewing gum is thrown away. This is the reason why a relatively large quantity of aroma agents is used in chewing gum compared to other 35 confectioneries. The aroma agents often being costly ingredients, the quantity of these in a chewing gum composition, although usually only present in a quantity of

around 0.5 to 2.0%, is of great importance to the price and consequently to the competitiveness of the product.

In recent years extensive research has been carried out 5 with respect to the use of chewing gum as a delivery system for medicines. This delivery system has proven especially suitable when a local effect in the oral cavity or the pharynx is desired or when an absorption of the medicine via the mucous membrane of the mouth is required in such 10 cases when it is desirable to avoid the so-called "first pass" effect, that is the catabolism in the liver at the first passage, or when the medicine is sensitive to the environment in the gastro-intestinal tract.

15 Several methods have been provided for the preparation of a chewing gum composition capable of releasing specific components in a controlled manner. Thus, a number of processes are known for obtaining an improved release of specific aroma agents and highly potent sweeteners with 20 the purpose of prolonging the perception of taste when chewing a chewing gum.

US patent No. 4,238,475 discloses a chewing gum comprising a water-insoluble therapeutic component which is coated 25 with a water-soluble coating agent to prevent resorption of the therapeutic component back into the gum base. The release of the therapeutic component is, however, conditional on the coating remaining intact during the chewing. As a result, the therapeutic component does not come into 30 direct contact with the oral cavity and cannot therefore be used for medicines intended to be locally effective in the oral cavity and the pharynx. Furthermore, the method of preparation is elaborate and further complicated by the fact that the coating must not be destroyed during 35 the preparation.

EP patent application No. 227,603 discloses a chewable

delivery system comprising an active agent coated with lecithin, polyoxyalkylene, glyceride etc and then incorporated in a matrix system comprising among other things gelatine, water and sweetener. Also in this case the active agent passes through the oral cavity in a coated form and will therefore not produce a local effect.

EP patent application No. 229,000 discloses a process and a chewing gum for the protection and controlled release 10 of an active agent, including medicine, highly potent sweeteners and aroma agents. The active agent is provided with a hydrophobic coating using a melt blend of polyvinyl acetate and plasticizer whereupon the blend is cooled, ground, sieved and blended with usual chewing gum ingredients. It is stated that a delayed release in the order 15 of 10 to 20 minutes can be obtained, but this does, however, not automatically result in an increase of the total quantity of substances released. The process is rather complicated and requires the active agent to be able to stand the temperatures involved in the process.

EP patent application No. 217,109 discloses a chewing gum in which prolonged and controlled release of, among other things, pharmaceutical agents, food ingredients and confectionery ingredients in multi-micro encapsulation hereof is obtained by means of, for instance, cellulose compounds, polyvinyl pyrrolidone, starch or saccharose etc. The process is, however, complicated and difficult to control.

30 US patents Nos. 4,493,849 and 4,597,970 disclose that lecithin can be used in chewing gum to improve the mouth-feel of the chewing gum and to increase the moistening properties and texture.

35 DK patent application No. 5386/83 discloses a method for obtaining longer impact times in the oral cavity when treating fungal infections in the oral cavity. This is

obtained by formulating antifungally active compounds, especially imidazole and triazole derivatives, with special gel agents such as cellulose ethers, sodium alginate and propyleneglycol alginate, in order to obtain a better adhesion of the active agent to the oral cavity. It is, however, unpleasant and difficult to keep such gelatinous preparations in the mouth for long and the impact of the active agent will vary considerably depending on how long it is kept in the mouth.

10

US patent No. 4,514,382 discloses a method for solubilization of the water-insoluble antigingivitis agent, imidazolyl-1,1-(p-chlorophenoxy)-3,3-dimethyl 2-butanone, in oral compositions. Mouth rinses, chewing gum, tooth powder and tooth paste are mentioned as oral compositions, but only the use in mouth rinses and tooth paste is documented. If, on the basis of what is stated in the above US patent, a person skilled in the art attempts to prepare a chewing gum with the amounts of solubilizer stated, it will be seen for most gum bases that the chewing gum base is also solubilized, which means that the chewing gum disintegrates when chewed and is thus totally unacceptable.

Thus, there is still a need for an acceptable chewing gum composition which can deliver an active agent of relatively limited solubility to be effective locally in the oral cavity or the pharynx or to be absorbed through the mucous membrane of the mouth, while still being pleasant to take or use, whether a medical effect or a relishing effect is desired as in the cases where the active agent is for instance a medicine or an aroma agent, respectively.

Surprisingly, it has been found that it is possible to obtain a chewing gum composition with accelerated controlled release of active agents comprising one or more active agents, a particular selected chewing gum base and usual auxiliary agents and additives.

Disclosure of Invention

The chewing gum composition according to the invention is
5 characterised in that the resin component of the chewing
gum base contains at least 25 weight% of a resin selected
among terpene resins, glycerolester of polymerised rosin,
pentaerythritol ester of wood or gum rosin, penta-
10 erythritol ester of partially hydrogenated wood or gum
rosin, glycerolester of partially hydrogenated wood or
gum rosin and high molecular weight polyvinyl acetate
resins with a molecular weight of at least 30,000 and
that at least one solubilizer in a quantity of 0.1-30
weight% has been added to the chewing gum composition.

15

Thus, according to the invention it has been found that
it is possible to obtain a substantial increase in the
released quantity of substances having poor water-solubi-
lity, compared to the release from conventional composi-
20 tions without the use of solubilizer.

It has generally been assumed that only small quantities
of surfactant can be added to chewing gum and from a theo-
25 retical point of view it would be assumed that the addi-
tion of larger quantities would usually result in extreme
softening and solubilization of the entire chewing gum
base portion. However, this has been found not to be the
case when as chewing gum base one is selected wherein
the resin portion consists of at least 25 weight% of the
30 above particularly suitable resins. In some cases such
chewing gum bases may per se contain a surfactant with a
slight solubilizing effect, however usually only in small
concentrations such as for instance 0-12 weight% of the
gum base and usually only from 0 to 6 weight% thereof.
35 Such surfactants, usually in the form of emulsifiers,
affect the gum base by emulsifying water thereinto. It has
turned out that these emulsifiers may have a slight solu-

blizing effect on an active agent added to the chewing gum, but this effect is usually of small extent compared to the solubilizing effect obtained by the solubilizers suggested according to the invention. The quantities of 5 solubilizers stated in the present specification and claims do not comprise such optional surfactants conventionally already contained in the chewing gum base used as starting material.

10 According to the invention it has been found that it is possible without heating by simply admixing a solubilizer, optionally by simple pre-mixing, to obtain an improved release of active agents without an unacceptable softening of the chewing gum taking place when said chewing gum 15 base is used.

It has been found that the solubilizer quantity is decisive of the extent of the release of a predetermined active agent. In the case of active agents which are released to 20 a smaller extent without the use of solubilizer (for instance 10-40 weight% after 10 minutes of chewing) it will often be necessary to add more than 1 weight% solubilizer to obtain a positive effect. In the case of active agents which have a very poor release without solubilizers 25 being added (for instance a few weight% after 10 minutes of chewing) a considerable increase in the release will be observed by merely adding 1 weight% solubilizer. The upper limit to the addition of solubilizers depends on the chewing gum formulation, the type of gum base, the 30 type of active agent and the quantity thereof and not least the type of solubilizer. Usually it will not be possible to add more than 30 weight% solubilizer without the consistency of the chewing gum becoming totally unacceptable, and often such large quantities are not 35 necessary or desirable as these often will result in a too rapid release. The selection of the type of solubilizer used and the quantity thereof will thus always depend on

the type and quantity of the active agent and of the chewing gum formulation in question. Tests have shown that a good release is obtained with a solubilizer concentration of 1-10 weight%, preferably 3-6 weight% without 5 the consistency thereby being unacceptable.

It is a further advantage of the invention that the solubilizer used is generally an inexpensive ingredient, which does not noticeably affect the price of the chewing gum 10 composition in the concentrations used, and that it does not require the procurement of expensive special apparatus.

It is an additional advantage of the chewing gum composition according to the invention that it is now possible 15 to prepare products with a new taste profile and/or effects, as active agents are released which, because of their poor rate of release, it was not economically sound to use before, or not possible at all and because they can 20 be released in other proportions.

Furthermore, several solubilizers have already been approved for use in food articles or accepted for use in medicines.

25 It is known that by placing active agents in the dragée layer of a chewing gum a faster and larger release can be obtained than the one obtained by a conventional incorporation of the active agent into the core of the chewing 30 gum. However, experience shows that the use of this principle means that although a larger portion of the active agent is released a large portion of said active agent is quickly resorbed by the gum base in the beginning of the chewing period whereby on the whole only a relatively 35 small advantage in the form of a larger release during the first minute of the chewing is obtained. With a chewing gum composition according to the invention it is, on the

other hand, possible to obtain a considerably more complete release over a longer chewing period, and it is also technically easier to incorporate the active agent in the core of the chewing gum itself compared with the incorporation in the dragée layer.

The further scope of the applicability of the invention will become apparent from the detailed description given 10 below. However, it should be understood that the detailed description and specific examples, while indicating preferred embodiments of the invention, are given by way of illustration only, since various changes and modifications within the spirit and scope of the invention will become 15 apparent to those skilled in the art from this detailed description.

A particular embodiment of the chewing gum composition is characterised in that the resin component of the chewing 20 gum base contains at least 40% of a resin selected among terpene resins, glycerol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester of partially hydrogenated wood or gum rosin, glycerolester of partially hydrogenated wood or gum rosin and 25 high molecular weight polyvinyl acetate resins with a molecular weight of at least 30,000.

In a further advantageous embodiment the chewing gum composition is characterised in that the resin component 30 of the chewing gum base contains a terpene resin of natural or synthetic origin.

In principle, all types of surfactants which do not display an unacceptable toxicity in the concentration used can be 35 used as solubilizer. As an example of types of surfactants to be used as solubilizer in a chewing gum composition according to the invention reference is made to H.P.

Fiedler, Lexikon der Hilfsstoffe für Pharmacie, Kosmetik und Angrenzende Gebiete, page 63-64 (1981) and the lists of approved food emulsifiers of the individual countries.

5

Both anionic, cationic, amphoteric and nonionic solubilizers can be used, but usually the solubilizer used is either anionic or nonionic as mainly such solubilizers are approvable for use in food or medicines. In cases 10 where the active agent is reactive it is usually an advantage to use a nonionic solubilizer as such are not very reactive and therefore do not affect the stability of the active agent unfavourably.

15 When selecting a solubilizer, the fact that such solubilizer must have an acceptable taste must also be taken into account. Therefore it will be natural to find the suitable substances among approvable food emulsifiers and emulsifiers acceptable for use in medicines for oral administration.

Suitable solubilizers include lecithines, polyoxyethylene stearate, polyoxyethylene sorbitan fatty acid esters, fatty acid salts, mono and diacetyl tartaric acid esters 25 of mono and diglycerides of edible fatty acids, citric acid esters of mono and diglycerides of edible fatty acids, saccharose esters of fatty acids, polyglycerol esters of fatty acids, polyglycerol esters of interesterified castor oil acid (E476), sodium stearoyllactylate, sodium lauryl sulfate and sorbitan esters of fatty acids, which solubilizers are all known for use as food emulsifiers, and polyoxyethylated hydrogenated castor oil (for instance such sold under the trade name CREMOPHOR), blockcopolymers of ethylene oxide and propylene oxide (for instance as 30 sold under the trade name PLURONIC or the trade name POLOXAMER), polyoxyethylene fatty alcohol ethers, polyoxyethylene sorbitan fatty acid esters, sorbitan esters of

fatty acids and polyoxyethylene stearic acid ester, all known in the EEC for use as pharmaceutical-cosmetical emulsifiers.

Particularly suitable solubilizers are polyoxyethylene stearates, such as for instance polyoxyethylene(8)stearate and polyoxyethylene(40)stearate, the polyoxyethylene sorbitan fatty acid esters sold under the trade name TWEEN, for instance TWEEN 20 (monolaurate), TWEEN 80 (monooleate), 10 TWEEN 40 (monopalmitate), TWEEN 60 (monostearate) or TWEEN 65 (tristearate), mono and diacetyl tartaric acid esters of mono and diglycerides of edible fatty acids, citric acid esters of mono and diglycerides of edible fatty acids, sodium stearoyllatylate, sodium laurylsulfate, polyoxy-15 ethylated hydrogenated castor oil, blockcopolymers of ethylene oxide and propyleneoxide and polyoxyethylene fatty alcohol ether. The solubilizer may either be a single compound or a combination of several compounds. The expression "solubilizer" is used in the present text to 20 describe both possibilities, the solubilizer used must be suitable for use in food and/or medicines.

It has been found that there may be a connection between the solubility profile of the active agent and the HLB value of the solubilizer used. However, it has not been possible to establish a correlation between the solubility parameters of the active agent and the HLB value of the solubilizer. In practice, it has been found that generally a good effect is obtained by using a solubilizer with a 30 HLB value in the range from 14 to 20, preferably 14-18. However, good effects have also been found with solubili-25 zers with HLB values in the range from 6 to 10, preferably 7-8. The HLB values used in the present specification and claims are taken from the literature or based on 35 information by the supplier. As to the determination of HLB values and examples of HLB values for different solu- bilizers, reference can be made to the above mentioned

H.P. Fiedler, Lexikon der Hilfsstoffe für Pharmacie, Kosmetik und angrenzende Gebiete, page 65-69, 1981.

The gum base used in the chewing gum according to the 5 invention is generally prepared in a conventional manner by heating and mixing the different ingredients such as elastomers, resins, inorganic fillers, waxes, fats and emulsifiers etc.

10 Any of the usual elastomers can be used in a quantity of typically 3-25 weight%. The elastomer may be of natural origin, for instance such as stated in Food and Drug Administration, CFR, Title 21, Section 172.615 , as "Masticatory Substances of Natural Vegetable Origin", or synthetic elastomers, such as styrene butadiene gum (SBR), butyl gum (isobutylene isoprene copolymer), or polyisobutylene (as stated in the above section of FDA under Masticatory Substances, Synthetic).

20 The inorganic fillers that form part of the chewing gum base may be present in a quantity of up to 50 weight%, preferably 0-30 weight%. Calcium carbonate, talc, sodium sulfate, aluminium oxide, magnesium carbonate, kaolin, silicium oxide and calcium phosphates alone or in a mixture 25 of more thereof may be mentioned as suitable fillers. Waxes and fats are conventionally used for the adjustment of the consistency and softening of the chewing gum base when preparing chewing gum bases. In connection with the present invention any conventionally used and suitable 30 type of wax may be used, such as for instance rice bran wax, polyethylene wax, petroleum wax (refined paraffin and microcrystalline wax), paraffin, bee wax, carnauba wax, candelilla wax, cocoa butter, degreased cocoa powder and any suitable oil or fat, as for instance completely 35 or partially hydrogenated vegetable oils or completely or partially hydrogenated animal fats. The quantity of wax used may be in the range from 0-50 weight%.

To soften the gum base further and to provide it with water binding properties, which gives the gum bases a pleasant smooth surface and reduces its adhesive properties, one or more emulsifiers may usually be added. Mono and diglycerides of edible fatty acids, lactic acid esters and acetic acid esters of mono and diglycerides of edible fatty acids, sugar esters of edible fatty acids, Na-, K-, Mg- and Ca-stearates, lecithin, hydroxylated lecithin and the like may be mentioned as examples of legal and conventionally used emulsifiers added to the chewing gum base.

As mentioned earlier, said emulsifiers, which are conventionally used in quantities of 0-12 weight%, preferably 0-6 weight% of the gum base, may have a solubilizing effect on the active agent, later added to a chewing gum prepared on the basis of such emulsifier containing chewing gum base. However, this effect is usually of a small extent compared to the effect of the solubilizers which in practice of the present invention usually are added during the preparation of the chewing gum and not to the chewing gum base.

Furthermore, the chewing gum base may contain the usual additives, such as antioxidants, for instance BHT, BHA, propylgallate and tocopherols as well as preservatives and colourants.

Resins should also be mentioned as a further component forming part of a chewing gum base, said resins being necessary to obtain the right chewing consistency and as solubilizer for the elastomers of the chewing gum base.

As mentioned above, the resin used is of importance to the chewing gum composition according to the invention. It has thus been found that not all conventionally used

resins are useable in a chewing gum base to be used in a chewing gum also containing a solubilizer.

Thus the addition of a solubilizer, even in small quantities of for instance from 0.5 weight%, often results in the chewing gum obtaining an unacceptable consistency by either turning unusually soft or, what is usually the case, totally disintegrating within the first few minutes of the chewing period.

10

However, it has been found that this can be avoided if at least 25% of the total resin quantity is comprised by one or more of the following essential resins: natural or synthetic terpene resins (as for instance the α - and β -pinene, dipentene or delta-limonene), glycerol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester or glycerol ester of partially hydrogenated wood or gum rosin or high molecular weight polyvinyl acetate resins with a molecular weight exceeding 20 30,000.

As mentioned, said essential resins must constitute at least 25%, especially 40%, of the total gum base resin to provide the gum base with acceptable properties. The gum base may contain one of the essential resins or a mixture of two or more of the essential resins.

Apart from the above condition that at least 25 weight% of the essential resins mentioned must be present, any of 30 the conventionally used resins may be used in the gum base, that is also glycerol ester of wood or gum rosin, glycerol ester of partially dimerised rosin, methyl ester of partially hydrogenated rosin and low molecular weight polyvinyl acetate, that is with a molecular weight below 35 30,000.

It is of course obvious to a person skilled in the art

that the precise necessary minimum quantity of the essential resins may depend on many different circumstances of the formulation of both the chewing gum base and the chewing gum.

5

For instance, the use of mainly low molecular weight elastomers and a high content of softeners, fats and waxes will often make it necessary to use a larger quantity of essential resins to obtain a satisfactory cohesive piece 10 of chewing gum.

Yet another embodiment of the composition according to the invention is characterised in that it furthermore contains up to 60 weight% of at least one carrier, which 15 carrier(s) forming a solid dispersion together with the active agent.

The carrier used to form the solid dispersion may be selected among all the substances which have proved useable 20 for this purpose, for instance polyethylene glycols, urea, polyvinyl pyrrolidone, sweeteners, such as sorbitol, xylitol, mannitol, sugar and dextrose, citric and succinic acids, bile acid and derivatives thereof, sterols and the like, surfactants, pentaerythritol and corresponding 25 globular compounds, polymers as well as urethane, fatty acid compounds, such as glyceryl oleate, cyclodextrines, ascorbic acid, acetamide, nicotinic acid, succinamide, sodium citrate, dextrans, methylcellulose, sodium alginate, gelatine, carrageenan, pectin, sodium carboxy 30 methylcellulose, polyvinyl alcohol, gum arabic, tragacanth, guar gum, and any combination of said substances, preferably polyethylene glycol or polyvinyl pyrrolidone, particularly preferable polyethylene glycol 1000-20,000, especially polyethylene glycol 6,000. A single carrier, 35 or when suitable, more carriers in combination may be used. The expression "carrier" is used in the present text to describe both possibilities.

The method of preparing the solid dispersion may be selected among all the methods which have proved useable for this purpose. The active agent and the carrier may for 5 instance be melted together and then cooled momentarily. The mixture is then ground and sieved to a suitable particle size. Alternatively, the active agent and the carrier is dissolved in a liquid which is evaporated to form a coprecipitation of the active agent and carrier, said 10 coprecipitation optionally being ground and sieved. Of these methods the former, also called the melting method, is often preferred, as the solvents used for the latter method are often hazardous to the health and therefore avoided.

15

The invention has proved advantageous for controlled, accelerated release of active agents selected among the group dietary supplements, oral and dental compositions, antiseptic agents, pH adjusting agents, anti-smoking 20 agents, sweeteners, flavourings, aroma agents or drugs, such as for instance paracetamol, benzocaine, cinnarizine, menthol, carvone, caffeine, chlorhexidine-di-acetate, cyclizine hydrochloride, 1,8-cineol, nandrolone, miconazole, mystatine, aspartame, sodium fluoride, nicotine, 25 saccharin, cetylpyridinium chloride, other quaternary ammoniumcompounds, vitamin E, vitamin A, vitamin D, glibenclamide or derivatives thereof, progesterone, acetyl-salicylic acid, dimenhydrinate, cyclizine, metronidazole, sodium hydrogencarbonate, the active components from 30 ginkgo, the active components from propolis, the active components from ginseng, methadone, oil of peppermint, salicylamide, hydrocortisone or astemizole.

The active agents to be used in connection with the present 35 invention may be any substance desired to be released from the chewing gum. The active agents for which an accelerated rate of release is desired, are primarily

substances with a limited water-solubility, typically below 10 g/100 ml inclusive of substances which are totally water-insoluble. Examples are medicines, dietary supplements, oral compositions, anti-smoking agents, highly potent sweeteners, pH adjusting agents, flavourings etc.

Examples of active agents in the form of dietary supplements are for instance salts and compounds having the nutritive effect of vitamin B₂ (riboflavin), B₁₂, folic acid, niacin, biotine, poorly soluble glycerophosphates, amino acids, the vitamins A, D, E and K, minerals in the form of salts, complexes and compounds containing calcium, phosphorus, magnesium, iron, zinc, copper, iodine, manganese, chromium, selenium, molybdenum, potassium, sodium or cobalt.

Furthermore, reference is made to lists of nutrients accepted by the authorities in different countries such as for instance US code of Federal Regulations, Title 21, 20 Section 182.5013.182 5997 and 182.8013-182.8997.

Examples of active agents in the form of compounds for the care or treatment of the oral cavity and the teeth, are for instance bound hydrogen peroxide and compounds capable of releasing urea during chewing.

Examples of active agents in the form of antiseptics are for instance salts and compounds of guanidine and biguanidine (for instance chlorhexidine diacetate) and the following types of substances with limited water-solubility: quaternary ammonium compounds (for instance ceramine, chloroxylenol, crystal violet, chloramine), aldehydes (for instance paraformaldehyde), compounds of dequaline, polynoxyline, phenols (for instance thymol, para chlorophenol, cresol) hexachlorophene, salicylic anilide compounds, triclosan, halogenes (iodine, iodophores, chloramine, dichlorocyanuric acid salts), alcohols (3,4 dichlo-

robenzyl alcohol, benzyl alcohol, phenoxyethanol, phenylethanol), cf. furthermore Martindale, The Extra Pharmacopoeia, 28th edition, page 547-578; metal salts, complexes and compounds with limited water-solubility, such as 5 aluminium salts, (for instance aluminium potassium sulfate $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$) and furthermore salts, complexes and compounds of boron, barium, strontium, iron, calcium, zinc, (zinc acetate, zinc chloride, zinc gluconate), copper (copper chloride, copper sulfate), lead, silver, magnesium, 10 sodium, potassium, lithium, molybdenum, vanadium should be included; other compositions for the care of mouth and teeth: for instance; salts, complexes and compounds containing fluorine (such as sodium fluoride, sodiummonofluorophosphate, aminofluorides, stannous fluoride), 15 phosphates, carbonates and selenium.

Cf. furthermore J. Dent.Res. Vol. 28 No. 2, page 160-171, 1949, wherein a wide range of tested compounds are mentioned.

20 Examples of active agents in the form of agents adjusting the pH in the oral cavity include for instance: acceptable acids, such as adipinic acid, succinic acid, fumaric acid, or salts thereof or salts of citric acid, tartaric acid, 25 malic acid, acetic acid, lactic acid, phosphoric acid and glutaric acid and acceptable bases, such as carbonates, hydrogen carbonates, phosphates, sulfates or oxides of sodium, potassium, ammonium, magnesium or calcium, especially magnesium and calcium.

30 Examples of active agents in the form of anti-smoking agents include for instance: nicotine, tobacco powder or silver salts, for instance silver acetate, silver carbonate and silver nitrate.

35 Examples of active agents in the form of sweeteners include for instance the so-called highly potent sweeteners, such

as for instance saccharin, cyclamate, aspartame, thaumatin, dihydrocalcones, stevioside, glycyrrhizin or salts or compounds thereof.

5 Further examples of active agents are for instance aroma agents of any type as well as medicines of any type.

Examples of active agents in the form of medicines include caffeine, salicylic acid, salicyl amide and related substances (acetylsalicylic acid, choline salicylate, magnesium salicylate, sodium salicylate), paracetamol, salts of pentazocine (pentazocine hydrochloride and pentazocine-lactate), buprenorphine hydrochloride, codeine hydrochloride and codeine phosphate, morphine and morphine salts (hydrochloride, sulfate, tartrate), methadone hydrochloride, ketobemidone and salts of ketobemidone (hydrochloride), β -blockers, (propranolol), calcium antagonists, verapamil hydrochloride, nifedipine as well as suitable substances and salts thereof mentioned in Pharm. Int., 10 Nov. 85, pages 267-271, Barney H. Hunter and Robert L. Talbert), nitroglycerine, erythrityl tetranitrate, strychnine and salts thereof, lidocaine, tetracaine hydrochloride, etorphine hydrochloride, atropine, insulin, enzymes (for instance papain, trypsin, amyloglucosidase, 15 glucoseoxidase, streptokinase, streptodornase, dextranase, alpha amylase), polypeptides (oxytocin, gonadorelin, (LH.RH), desmopressin acetate (DDAVP), isoxytropine hydrochloride, ergotamine compounds, chloroquine (phosphate, sulfate), isosorbide, demoxycitin, heparin.

20
A further particularly preferred preparation according to the invention comprises up to 50 weight%, preferably 0.1-10 weight% active agent in the form of a solid dispersion hereof in a carrier, up to 60 weight%, preferably approximately 25 weight% of the carrier used to obtain the solid dispersion, 0.1-30 weight%, preferably 0.1-10 weight% solubilizer, 15-80 weight%, preferably approximately 35

weight% chewing gum base and up to 85 weight%, preferably approximately 35 weight% auxiliary substances and additives.

5 A particularly preferred preparation according to the invention comprises up to 50 weight%, preferably 0.1-10 weight% active agent admixed with at least one solubilizer, 15-80 weight%, preferably approximately 35 weight% chewing gum base, up to 85 weight%, preferably approximately 50-60 weight% auxiliary agents and additives and 0.1-30 weight%, preferably approximately 5 weight% solubilizer.

The invention further relates to a process for the preparation of a chewing gum composition, which process is characterised by preparing a chewing gum base on the basis of conventional chewing gum base constituents, wherein the resin portion consists of at least 25 weight% of a resin selected among terpene resins, glycerol ester of polymerised rosin, pentaerythritol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester of partially hydrogenated wood or gum rosin, glycerol ester of partially hydrogenated wood or gum rosin and high molecular weight polyvinyl acetate resins with a 25 molecular weight of at least 30,000, and then in a conventional manner preparing a chewing gum composition while adding active agent, solubilizer and other conventional ingredients.

30 A particular embodiment according to the invention is characterised in that the active agent is intimately mixed with the solubilizer, optionally during heating, before adding to the chewing gum composition.

35 If a carrier is used, the process may advantageously be carried out by forming a solid dispersion of the active agent in a carrier prior to mixing the active agent with

the solubilizer.

The invention furthermore relates to the use of a solubilizer for accelerated controlled release of active agents 5 in a chewing gum composition. By such use it is possible to obtain an increase in the rate of release and thereby an increase in the total quantity released during a given chewing period.

10 As auxiliary agents and additives selected for use in the inventive chewing gum composition any auxiliary agents and additives for the conventional use in chewing gum may be used. Examples thereof are sweeteners, aroma agents, colourants and softening and consistency adjusting 15 agents

Sweeteners usable for the chewing gum composition include for instance sorbitol, xylitol, mannitol, palatinol, malbit, lactitol, hydrogenated glucose syrup, saccharose, 20 glucose syrup, fructose, dextrose, lactose, sorbose and intensive natural or synthetic sweeteners, such as saccharin, cyclamate, aspartame, acesulfame K, thaumatin, glycyrrhizin, dihydrochalcones and salts and derivatives hereof. The choice of sweetener or sweeteners will partly 25 depend on whether a sugar-free product is required or not, partly on which consistency and sweetness are required in the composition according to the invention.

It is possible to use smaller quantities of many of the 30 conventionally used highly potent sweeteners because of their increased release.

The aroma agents usable for the chewing gum composition are for instance natural and synthetic flavourings (including nature identical flavourings) in the form of essential oils, essences, extracts, powders, including acids and other substances capable of affecting the taste profile. 35

Examples of liquid and powdered flavourings include coconut, coffee, chocolate, vanilla, grape fruit, menthol, liquorice, anise, apricot, caramel aroma, honey aroma, pineapple, strawberry, raspberry, tropical fruits, cherries, cinnamon, peppermint, wintergreen, spearmint, eucalyptus and mint. As mentioned above, the aroma agent may in many cases be used in quantities smaller than those conventionally used.

10 There are no special requirements to the colourants, which may be of natural or synthetic origin, except that they must be approvable for use in food and medicines.

Glycerol, propylene glycol, lecithin, triacetin, hydrogenated glucose syrup, sorbitol 70%, glucose syrup, waxes and oils can be mentioned as suitable softeners or consistency adjusting agents for use in the composition according to the invention. As a result, the product is provided with a consistency pleasant for chewing during 20 the desired chewing period.

The formulation of the chewing gum base depends on the type of chewing gum desired as described above or the required type of structure. Suitable raw materials for 25 the gum base comprise substances according to U.S. Chewing Gum Base Regulations - Code of Federal Regulations, Title 21, Section 172.615.

It is a particular advantage of the invention that the 30 chewing gum composition can be prepared using conventional ingredients, conventional equipment and conventional methods of preparation.

When the active agent has been incorporated in the chewing 35 gum vehicle, this product may be of any known type, such as bits, optionally provided with a dragée, and sticks or chewing gum of any other desired form. The chewing gum

23

pieces may be coated with a type of wax, a film coating or a conventional so-called candy coat based on sugar-containing or sugar free substances.

5 A single piece of chewing gum usually weighs between 0.4 and 20.0 g. The following Table indicates the preferred intervals for the different product types:

Chewing gum bits	500-3,500 mg
10 Coated chewing gum	600-6,000 mg
Chewing gum sticks	1,000-5,000 mg

When the individual ingredients forming part of a chewing gum composition according to the invention are mentioned 15 in singular, such mention also comprises a combination of several such ingredients, apart from instances where one particular ingredient is mentioned.

Best Mode for Carrying Out the Invention

20

The invention is illustrated in more details below by means of the Examples, which are not limitative of the present invention.

25

30

35

ExamplesGeneral Methods5 Preparation of Chewing Gum Base

A chewing gum base is prepared on the basis of the following ingredients:

10	Elastomers	4 weight%
	Terpene resin	28 weight%
	Low molecular weight PVA	29 weight%
	Emulsifier	8 weight%
	Waxes	31 weight%

15

The elastomer is ground in a conventional mixer for the preparation of chewing gum and gum base while being heated to 110-130°C and terpene resin and low molecular weight PVA are added slowly in small portions. Finally waxes and 20 emulsifier are added. To ensure a homogenous base it is important that all the ingredients are added in small portions and that the subsequent portions are not added until the preceding portion is ground.

25 It has been found that the resulting chewing gum base does not disintegrate when the solubilizer is added.

Preparation of Chewing Gum

30

The chewing gum prepared in the examples have been formulated on the basis of the following basic formulation:

Basic Formulation 1

35

Gum base	35 weight%
Sorbitol powder	10 weight%

Hydrogenated glucose syrup	10 weight%
Active agent	0.01-30 weight%
Solubilizer	1-20 weight%
Optional flavour	1.9 %
5 Optional additional sorbitol powder q.s.	100 weight%

The chewing gum pieces are prepared in the manner conventional for the preparation of chewing gum and using a conventional apparatus for the preparation of chewing 10 gum.

The chewing gum base is melted or ground in a conventional chewing gum mixer. When the chewing gum base is homogenous, the other ingredients are admixed one by one in the order 15 mentioned. Solubilizer and active agent may be admixed separately or in the form of a premixture or in a solution. Depending on the state of the ingredients and their melting point, such premixture may be a simple mixture of two or more powders, a mixture of one or more powders in one or 20 more liquids or a mixture of more liquids at ordinary, increased or lower temperature. To ensure a good dispersion of the ingredients it may, especially when adding very small quantities of one or more of the components of the premixture, be an advantage to add these as a liquid 25 mixture or a solution where this is possible.

It is also possible to premix or dissolve the active agent and the solubilizer into other ingredients of the formulation, for instance hydrogenated glucose syrup, flavourings, 30 sorbitol or into the gum base itself, if deemed suitable.

Apart from admixing the gum base first, the order of the admixture is not critical. However, the mixing time after the admixture of the active agent and solubilizer should 35 be of a duration long enough to ensure a sufficiently good dispersion of these ingredients in the chewing gum mass. Optionally supplementary flavourings are usually added

lastly followed by mixing for 2 to 3 minutes.

Upon completion of the mixing, the homogenous chewing gum mass is removed from the mixer and cut out and left to cool in small pieces or is extruded to a thin sheet which is led through a cooling apparatus. The cooled mass is then extruded to a thin sheet, which is rolled on a conventional chewing gum rolling system and cut into bits of appropriate form and size.

10

The bits are left to harden for two to five days and are then separated by tumbling in a conventional dragée pan. Subsequently, the bits are completed by applying a thin polishing layer by film coating or a dragée coating is provided.

In Examples 1 to 143 below chewing gum bits with a weight of 800 mg are cut out and coated with a thin layer of sorbitol with a little flavouring added. The chewing gum bits now weigh 820 mg each.

The release of the active agent in Examples 1 - 143 are determined either *in vitro* or *in vivo*.

25 In vitro

The tests *in vitro* are carried out on a chewing machine (L. Christrup et al., Arch. Pharm. Sci., 1986, 14, pages 30-36) by chewing one piece of chewing gum with a weight of 820 mg for 30 minutes in a phosphate buffer with a pH of 7.4. The results stated in the Tables are the relative release of the active agent, the release without solubilizer having been set at 100%.

35 In vivo

The test *in vivo* are all carried out by letting a person

chew the chewing gum for 2, 5 and 10 minutes, respectively, whereupon the remaining content of the active agent in the chewed bit is analyzed in order to determine the quantity released.

5

At the tests *in vivo* the results also indicate relative release, the release without solubilizer having been set at 100%.

10

Example 1-12

The use of monoglyceride diacetyl tartaric acid ester, PANODAN 165 from Grindsted Products A/S, Denmark, as 15 solubilizer, HLB 7, was tested *in vitro* in the manner described above. The results appear from Table 1.

40

Examples 134-137

The use of stearoyllactylate, ARTODAN SP55 from Grindsted 45 Products A/S, Denmark, HLB 2, as solubilizer was tested in vitro in the manner described above. The results appear from Table 19.

Table 19

Example No.	ARTO - DAN SP55 weight%	Active agent	Content %	Relative Release 2 min.10 min.30. min		
134	1	NYSTATIN	6.25	9100	18100	11100
135	0	NYSTATIN	6.25	100	100	100
136	5	MICONAZOLE	6.25	U	10000	7200
137	0	MICONAZOLE	6.25	100	100	100

15

Examples 138-141

The use of sodium laurylsulfate as solubilizer was tested 20 in vitro in the manner described above. The results appear from Table 20.

Table 20

Example No.	Na-laur-sulf. weight%	Active agent	Content %	Relative Release 2 min.10 min.30. min		
138	1	NYSTATIN	6.25	14000	18500	11300
139	0	NYSTATIN	6.25	100	100	100
140	5	MICONAZOLE	6.25	U	12000	650
141	0	MICONAZOLE	6.25	100	100	100

35

Examples 142-143

The use of lecithin as solubilizer was tested in vitro in 40 the manner described above. The results appear from Table 21.

Table 21

Example No.	Lecithin weight%	Active agent	Content %	Relative Release 2 min.10 min.30. min		
142	1	NYSTATIN	6.25	170	290	410
143	0	NYSTATIN	6.25	100	100	100

Example 144

The present example illustrates the use of a dispersion
5 of the active agent in a carrier in the chewing gum com-
position according to the invention.

<u>Ingredient</u>	<u>Weight</u>
Gum base	35.8
10 Hydrogenated glucose syrup	10.0
Miconazole	5.6
Lecithin	6.6
PEG 6000	21.8
Sorbitol	18.3
15 Aroma agent	1.9

5.6 g miconazole is mixed with 21.8 g polyethylene glycole 6000. The mixture is heated to 85°C for 5 to 10 minutes.
The melt blend is cooled to 10-15°C on aluminum sheets
20 before being ground and sieved to a particle size of approximately 300 µm. The powdered solid dispersion is mixed with 6.6 g lecithin and added to the chewing gum mass.

25 Chewing gum bits are then prepared as described under general methods.

In the actual example the bits are cut into bits of 900 mg which are subsequently coated with a thin layer of 30 sorbitol with a little flavouring added. The weight of each bit is then 920 mg.

Examples 145 - 148 and comparison examples A-B

35 Further chewing gum compositions analogous with example 144 are prepared in the manner described above.

Example 145

<u>Ingredient</u>	<u>Weight%</u>
Gum base	35.8
5 Hydrogenated glucose syrup	10.0
Miconazole	5.5
Lecithin	6.6
Sorbitol	40.2
Aroma agent	1.9

10

The preparation takes place analogous with example 144 apart from the fact that of course no preparation of a solid dispersion takes place.

15 Comparision example A

<u>Ingredient</u>	<u>Weight%</u>
Gum base	35.8
Hydrogenated glucose syrup	10.0
20 Miconazole	5.6
Sorbitol	46.7
Aroma agent	1.9

25 Example 146

<u>Ingredient</u>	<u>Weight%</u>
Gum base	35.8
Hydrogenated glucose syrup	10.0
30 Nystatin	6.25
Tween TM 60	6.25
Sorbitol	39.8
Aroma agent	1.9

Example 147

<u>Ingredient</u>	<u>Weight</u>
Gum base	35.8
Hydrogenated glucose syrup	10.0
5 Nystatin	6.25
Cremophor™ RH 40	6.25
Sorbitol	39.8
Aroma agent	1.9

10 Example 148

<u>Ingredient</u>	<u>Weight</u>
Gum base	35.8
Hydrogenated glucose syrup	10.0
Nystatin	6.25
15 Panodan™ AB 90	6.25
Sorbitol	39.8
Aroma agent	1.9

Comparison example B

<u>Ingredient</u>	<u>Weight</u>
Gum base	35.8
Hydrogenated glucose syrup	10.0
Nystatin	6.3
Sorbitol	46.0
25 Aroma agent	1.9

Test results from in vitro and in vivo test of chewing gum compositions according to the invention

30

The results indicated in Table 22 below are the result of an in vivo test of chewing gum compositions according to the examples 144-145 compared to the chewing gum composition according to comparison example A carried out on 6 test persons, measured after chewing of 1 chewing gum bit with a weight of 900 mg for 30 minutes. The figures indicate µg miconazole per ml. of saliva.

Table 22

Example No.	Time (min.)				
	2	10	30	60	120
5 144	36.6	6.5	8.7	1.4	0.7
145	18.8	12.7	10.7	2.0	1.2
Comparison example A	3.7	1.8	1.9	0.5	0.3

10 As appears from the above Table, a clearly increased rate of release and an increase in the quantity released are obtained with the preparations according to the invention compared to the comparison composition.

15 Furthermore in vitro tests of the preparations according to the examples 146, 147 and 148 and comparison example B were carried out on a chewing machine by chewing 1 chewing gum bit with a weight of 800 mg for 30 minutes. The figures indicate the average value of the three chewings stated as 20 µg nystatin per ml. phosphate buffer, pH value 7.4.

Table 23

Example No.	Time (min.)		
	2	10	30
25 146	807.7	70.6	7.0
147	1680.9	57.8	5.2
148	1917.8	44.1	2.6
Comparison example B	6.4	5.9	3.2

Again it is clearly seen that a significant improvement of the rate of release and the quantity released from the compositions according to the invention are obtained compared to the comparison composition.

Example 149

In addition to the basic formulation 1 above a number of further chewing gum formulations have been tested. Tests 5 have thus been carried out with both the same gum base and with other gum bases.

a) Same gum base

10 At these tests nystatin and paracetamol were used as active agents and TWEEN 60 as solubilizer. The formulations tested differ from the basic formulation 1 in having higher or lower gum base content, the admixture of inorganic filler, the use of other flavourings (fruit, spearmint) and other 15 sweeteners (xylitol, glycerol). In these test the known effect was demonstrated, that is that a higher base content results in a slower and lesser release, but apart from this, the same improved release pattern as a result of the addition of a solubilizer was seen.

20

b) Other gum bases

Furthermore, tests have been made wherein the terpene resin in basic formulation 1 has been replaced by others 25 of the essential resins stated in claim 1. Chewing stable chewing gums with the desired accelerated release of the active agent were obtained.

The invention being thus described, it will be obvious 30 that the same may be varied in many ways. Such variations are not to be regarded as deviations from the idea and scope of the inventions and all such modifications as would be obvious to persons skilled in the art, are intended to be included within the scope of the following 35 claims.

Claims

1. Chewing gum composition with accelerated, controlled release of active agents, comprising one or more active agents and additives, a chewing gum base and optionally usual auxiliary agents, characterized in that the resin component of the chewing gum base contains at least 25 weight% of a resin selected among terpene resins, glycerol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester of partially hydrogenated wood or gum rosin, glycerol ester of partially hydrogenated wood or gum rosin and high molecular polyvinyl acetate resins with a molecular weight of at least 30,000 and that at least one solubilizer in a quantity of 0.1-30 weight% has been added to the chewing gum composition.

2. Chewing gum composition as claimed in claim 1, characterized in that the resin component of the chewing gum base contains at least 40% of a resin selected among terpene resins, glycerol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester of partially hydrogenated wood or gum rosin, glycerol ester of partially hydrogenated wood or gum rosin and high molecular weight polyvinyl acetate resins with a molecular weight of at least 30,000.

3. Composition as claimed in claim 1 characterized in that the resin component of the chewing gum base contains a terpene resin of natural or synthetic origin.

4. Composition as claimed in claim 1, characterized in that the solubilizer of the composition is selected among lecithin, polyoxyethylene sorbitan fatty acid esters, fatty acid salts, mono and diacetyl tartaric

acid esters of mono and diglycerides of edible fatty acids, citric acid esters of mono and diglycerides of edible fatty acids, saccharose esters of fatty acids, polyglycerol esters of fatty acids, polyglycerolesters of internal esterified castor oil acid, sodium stearoyllactylate, sodium lauryl sulfate, sorbitan esters of fatty acids, polyoxyethylated hydrogenated castor oil, blockcopolymers of ethylene oxide and propylene oxide, polyoxyethylene fatty alcohol ether, sorbitan ester of fatty acid or 10 polyoxyethylene stearic acid ester.

5. Chewing gum composition as claimed in claim 4, characterized in that the solubilizer is polyoxyethylene stearate, polyoxyethylene sorbitan fatty acid 15 ester, mono and diacetyl tartaric acid esters of mono and diglycerides of edible fatty acids, citric acid ester of mono and diglycerides of edible fatty acids, sodium stearoyllactylate, sodium laurylsulfate, polyoxyethylated hydrogenated castor oil, blockcopolymers of ethylene oxide 20 and propylene oxide or polyoxyethylene fatty alcohol ether.

6. Chewing gum composition as claimed in claim 1, characterized in that a solubilizer with a HLB value of 14-20 is used.

25

7. Chewing gum composition as claimed in claim 1, characterized in that a solubilizer with a HLB value of 6-10 is used.

30 8. Chewing gum composition as claimed in claim 1, characterized in that 1-10 weight% solubilizer is added to the chewing gum composition.

35 9. Chewing gum composition as claimed in claim 8, characterized in that 3-6 weight% solubilizer is added to the chewing gum composition.

10. Chewing gum composition as claimed in claim 1, characterised in that the composition further contains up to 60 weight% of at least one carrier, which 5 carrier(s) forms a solid dispersion together with the active agent.

11. Composition as claimed in claim 10, characterised in that the carrier is selected among poly-10 ethylene glycol and polyvinyl pyrrolidone.

12. Composition as claimed in claim 11, characterised in that the carrier is polyethyleneglycol 1000-20,000.

15 13. Composition as claimed in claim 1, characterised in that the active agent(s) has a water-solubility of less than 10 g/100 ml.

20 14. Chewing gum composition as claimed in claim 13, characterised in that the active agent is selected among the group comprising dietary supplement, oral and dental compositions, antiseptics, pH adjusting agents, anti-smoking agents, sweeteners, flavourings, 25 aroma agents or medicines.

15. Chewing gum composition as claimed in claim 14, characterised in that the active agent is selected among paracetamol, benzocaine, cinnarizine, 30 menthol, carvone, caffeine, chlorhexidine-disacetate, cyclizine hydrochloride, 1,8-cineol, nandrolone, miconazole, nystatin, aspartame, sodium fluoride, nicotine, saccharin, cetylpyridinium chloride, other quaternary ammonium-compounds, vitamin E, vitamin A, vitamin D, glibenclamide 35 or derivatives thereof, progesterone, acetylsalicylic acid, dimenhydrinate, cyclizine, metronidazole, sodium hydrogencarbonate, the active components from ginkgo, the

active components from propolis, the active components from ginseng, methadone, oil of peppermint, salicylamide, hydrocortisone or astemizole.

5 16. Process for the preparation of a chewing gum composition as claimed in claim 1, characterised by preparing a chewing gum base on the basis of conventional chewing gum base ingredients, wherein the resin portion consists of at least 25 weight% of a resin selected among 10 terpene resins, glycerol ester of polymerised rosin, pentaerythritol ester of polymerised rosin, pentaerythritol ester of wood or gum rosin, pentaerythritol ester of partially hydrogenated wood or gum rosin, glycerol ester of partially hydrogenated wood or gum rosin and high 15 molecular weight polyvinyl acetate resins with a molecular weight of at least 30,000, and then in a conventional manner preparing a chewing gum composition while adding active agent, solubilizer and other conventional ingredients.

20 17. Process as claimed in claim 16, characterised by mixing the active agent intimately with the solubilizer, possibly during heating, before admixing to the chewing gum composition.

25 18. Process as claimed in claim 17 for the preparation of a chewing gum composition as claimed in claim 10, characterised in that prior to mixing the active agent with the solubilizer, a solid dispersion of the 30 active agent is formed in a carrier.

19. The use of a solubilizer for accelerated, controlled release of active agents in a chewing gum composition.
